

Ancient Egyptian mummies still smell nice, study finds

Even after 5,000 years in a sarcophagus, mummified bodies from ancient Egypt still smell quite nice, scientists have discovered. Researchers who examined nine mummies found that though there was some difference in the intensity of their odours, all could be described as "woody", "spicy" and "sweet".

They say recreating the composition of the smells chemically will allow others to experience a mummy's whiff - and help to tell when the bodies inside may be starting to rot. "We want to share the experience we had smelling the mummified bodies, so we're reconstructing the smell to be presented in the Egyptian Museum in Cairo," Cecilia Bembibre, one of the researchers, Today programme.

During the mummification process, ancient Egyptians would surround the body with pleasant smells as an important part of preparing a spirit to enter the afterlife.

As a result, pharaohs and members of the nobility were adorned with oils, waxes and balms during the mummification process. In films and books, terrible things happen to those who smell mummified bodies," said Dr Bembibre said. "We were surprised at the pleasantness of them." The authors of the academic study, published in the Journal of the American Chemical Society on Thursday, had to get the smell from inside the sarcophagus without interfering with the mummy inside.

The researchers, from UCL and the University of Ljubljana in Slovenia, did so by inserting a tiny tube so they were able measure the scent without taking any physical samples. Dr Bembibre explained that heritage scientists are always trying to find "non-destructive" ways to discover new information. They found odours relating to the break-down of animal fats used in the embalming process, which could indicate the body is beginning to decompose.

Because of these findings, it will be possible to "practically intervene" in the conservation of the mummies, identifying how best to store and wrap the bodies, the research paper said.
